

Develin Creek Project Factsheet

Australia's Next Copper & Gold Developer...

PROJECT: Develin Creek

CURRENT RESOURCE: 3.2Mt @ 1.61% CuEq for 51,360t CuEq

OWNERS:

QMines Limited (51%) & Zenith Minerals (49%)

OWNEDSHID: Rights to 100%

DEPOSIT TYPE:

ulphide Deposit (VHMS)

TENURE:

Project Overview

The Develin Creek Project is approximately 90km west of Rockhampton in Queensland. The Project consists of two tenements, EPM 17604 and EPM 16749 for a total area of 272km².

On 28th August 2023, QMines acquire an initial interest of 51% of Develin Creek from Zenith Minerals Limited (ASX:ZNC) and retains the right to acquire the remaining 49% interest within 12 months.

Exploration Strategy

QMines plans to complete infill drilling to improve resource confidence, step out drilling to assess the potential for a larger resource and development drilling comprising metallurgy and geotechnical drilling to determine the deposits suitability for potential future mining.

JORC RESOURCE: 3.2Mt @ 1.61% CuEq

CONTAINED METAL: 51,360t CuEq

JORC CATEGORY: 47% Indicated

Cut Off Grade: 0.5% CuEq

HISTORIC DRILLING: 224 holes for 44,228m

Project History

Mineralisation at Scorpion, Window and Sulphide City were discovered and initially drilled to 50m spacing by Queensland Metals Corporation (**QMC**) in the early 1990s. Eventually the project was relinquished, and the current tenement granted to loop Pesquirces

Icon vended the project into Fitzroy Resources as part of an Initial Public Offering in 2010. Fitzroy undertook a small drilling program to extend the known resource in 2011.

Verification drilling by Zenith Minerals using RC and diamond drilling occurred in 2014, 2021 and 2022.

Project Geology

The Develin Creek project consists of several Volcanic Hosted Massive Sulphide (**VHMS**) copper-zinc deposits.

The Develin Creek project covers part of the Rookwood Volcanics which form a narrow, discontinuous north-south orientated belt that extends the length of the project and hosts the known base metals mineralisation. The Rookwood Volcanics are variably exposed and concealed by lateritised tertiary sediments, and younger quaternary deposits.
